Abstract: Some diurnal *Lepidoptera* species attracted to the light-trap in East Anatolia (*Papilionoidea*, *Zygaenoidea*). – Cesa News 40: 1-4, 6 figs.

In this paper, night flight of five diurnal species in *Papilionoidea* and *Zygaenoidea* collected between the years 2004-2008 in Van Lake Basin are reported. Information about collecting data are given. Literary data on this subject are evaluated briefly.

Key words: *Papilionoidea*, *Zygaenoidea*, *Lepidoptera*, ecology, night flight, diurnal.

It is said that many night-flying insects are attracted to artificial lights as they use light to navigate. Scientists believe that insects fly at night evolved over millions of years, there were no artificial lights at night. The only light was the moon, and insects that fly directly towards the moon at night will travel in straight line. Therefore this behavior is useful for them helping to navigate in the dark. It is an instinct, meaning they don't think about it, they just do it, because over the millions of years they have existed, insects that could navigate at night did better than those that couldn't. Insects that fly towards an artificial light, however, will crash into it and often hurt themselves. They can't avoid it because it's an instinct. If we had another few million years to watch process, eventually insects might stop doing it – but not yet; it's only been a few hundred years. Although moths are attracted to artificial light, they keep away from sunlight. Butterflies on the contrary are attracted to sunlight but are repelled by artificial light. Butterflies are tuned to high intensities of light and moths to low intensities, so that the bright light attracts the butterflies and feeble lights attracts the moths.

Especially as less intensive blue and violet lights having short wavelengths attract moths, we use light traps bearing fluorescent (15-20 or 40Watt tubes) which emit these colours in our field studies in the night.

After examining literary data from various parts of the World (Turkey, USA, Mexico, Central America, India, East Africa, Mediterranean islands, and Australia), concerning diurnal Lepidoptera that attracted to artificial lights, it was seen that these species belong to *Papilionidae*, *Pieridae*, *Satyridae*, *Lycaenidae*, *Danaidae*, *Nymphalidae* and *Zygaenidae* (Sevastopulo (1948, 1955, 1958, 1964), Best (1951, 1956), Usman (1956), Mather (1959), Anderson (1960), Thorne (1960), Philips (1961), Bouton (1962), Curtis and Boscoe (1962), Donahue (1962), Emmel (1962), Schull (1963, 1964), Welling (1963), Butler (1964), Kimball (1965), Heitzman (1965, 1969), Oliver (1966), Wilkinson (1966), Shull and Nadkemy (1967), Wood (1969), Miller (1970), Kendall and Glick (1972), Koçak (1986), Sharma and Chaturvedi (1999), Vinayan (2001), and Tarmann (2004).

In the course of the field studies in the nights carried out by authors between the years of 2004 and 2008 in the Van Lake Basin, five diurnal species were collected after a time of flying around the light trap while resting. Four of them belong to *Papilionoidea* (*Chazara* (*Neochazara*) *anthe*, *Argynnis* (*Pandoriana*) *pandora*, *Polyommatus* (s.str. (*Meleageria*)) *daphnis*, *Cynthia* *cardui*) and the last one to *Zygaenoidea* (*Zygaena* (*Mesembrynus*) *cuvieri*), whose members flies always by day. Remarkable night flying record of *Charaxes jasius* in Turkey was reported by Koçak (1986).

The collected specimens by night are given below, together with their collecting data.

Announcement

Within the seminar activities of the AVAM the following films of the Cesa will be presented by Dr. Muhabbet Kemal on 10th April, 2009, at 2 p.m. in the Conference Room of the Faculty of Fine Arts, Yüzüncü Yıl University, Van.

Presentation of the two scientific films by the Cesa in Van for the first time.

Kemal, M., 2006, A World Inheritance

A DVD Documentary Film. This film deals with Nemrut Mount, its Caldera, and biodiversity. Numerous plant species are illustrated and filmed for the first time in their natural living places. Totally 87 butterflies are recorded and listed here. Environmental problems are mentioned together with their images, and discussed from the scientific standpoint. 28 minutes. [*first released on 11 October 2006*].

Kemal, M., 2008, Dancing behaviours of an unknown “Pith Moth” species in North Thailand (Lepidoptera, Cosmopterigidae).

Iconographia Insectorum (Series A), Documentary video records in nature for scientific purpose. mpeg2 format, 11 minutes 54 seconds [*first released on 23 November, 2008*] [see also Cesa News 36, page 25].

Mrs. and Mr. Bozacı (butterfly photographers and observers from İzmir) visited us for participating to the visual presentation "*Butterfly Diversity in Anatolia*" (170 images), presented on 16th January 2009 by Muhabbet Kemal.

Next day, the Muradiye waterfall, situated about 100km North of Van city, visited for the purpose of photographing the effects of the winter season. The participants were Mrs. and Mr. Bozacı, Mrs. Muhabbet Kemal, Mr. Lokman Kayci, and Mr. Halil Özkol. Eleven images by Muhabbet Kemal are given below:

Entomofauna of Turkey (ET)

Report on the “Entomofauna of Turkey” 3- Revised and expanded index of the recorded genera and species of the Pterygot Insects of Turkey

**Ahmet Ömer Koçak Muhabbet Kemal
Halil Özkol Lokman Kayci**

This is the third temporary results¹ of the Project “*Entomofauna of Turkey*” by the Cesa.

In the previous report toptally 2951 pterygot species were reported in Turkey. Now, this number increased to 3606. Similarly, the number of the genera recorded in Turkey increased from 1044 to 1197.

In the present report, the genera and the species are indexed separately. Synonyms, if checked up, are attached (as blue italics) to the taxa for the first time.

The following alphabetical indexes of the valid generic and specific names of the pterygot insects of Turkey are the initiative ones, recorded in the Info-system of the Cesa so far.

The scientific names are given below with the authors, usually with the date of publications, and their families. The validity of the names are confirmed here from the taxonomical and nomenclatural standpoints. In the list below the *Lepidoptera* of Turkey is excluded.

Updated number of the species of the pterygot insects of Turkey (based upon the Info-system of the Cesa) is 8770.

Next reports concerning this ongoing Project will be published in this serial at irregular intervals.

I- Index of the genera of pterygot insects recorded in Turkey

In the first part of this report, totally 1197 genera are indexed. Family of each scientific name is mentioned. Synonyms, if available, are added.

¹ For the previous list, see Cesa News nr. 36.
